

SOY BASED INFANT FORMULA

Soy-based infant formula has been available for almost 40 years. To date, soy-based infant formula has proven to be a safe, healthy way to support the normal growth and development of infants.

Soy-based infant formula is a nutritious feeding choice for full-term infants born without the ability to digest lactose or with an allergy to milk protein. It is also a popular alternative for parents who want their infants to follow a vegetarian-based diet.

There is no reason why soy-based infant formula should only be administered on medical grounds.

Indeed, some research suggests that consumption of soy throughout life may be an aid to maintaining good health well into later adult years.

EUVEPRO members are leaders in food applications development. Its members are committed to the research and application of the health benefits of soy.

13 December 2007

EUVEPRO is the European federation of manufacturers, distributors and users of vegetable proteins for human consumption. The trade association was founded in 1977.

EUVEPRO's main objective is to create a favourable environment for the use of vegetable proteins in nutrition within the framework of EU legislation. It participates in the development of EU health legislation, protects the workings of the internal market and monitors agricultural issues.

EUVEPRO's members are European based manufacturers, distributors and users of vegetable proteins. The current membership represents the vast majority of vegetable proteins supplied to the European market.
